

Drawing Circles with UITouch

September 08, 2012

This tutorial shows how to draw circle with the Core Graphics Framework. The circles will be drawn in different sizes every time the user taps the screen. This tutorial is made with Xcode 4.4 and uses the iOS 5 target.

Update: Oct 13, 2014. The rewritten version in Swift for iOS 8 and Xcode 6 is available [here](#).

Let's start. Create a new Project. Select Single View Application.

Fill in the following Project Settings.

Create a New File. Select Objective-C Class. Call the class iOSCicle with a subclass of NSObject. This class will contain the circle characteristics.

Add the following properties to iOSCicle.h. circleCenter will be the touch point on the screen and the radius will be a random number.

```
@interface iOSCicle : NSObject

@property (nonatomic) CGPoint circleCenter;
@property (nonatomic) float circleRadius;

@end
```

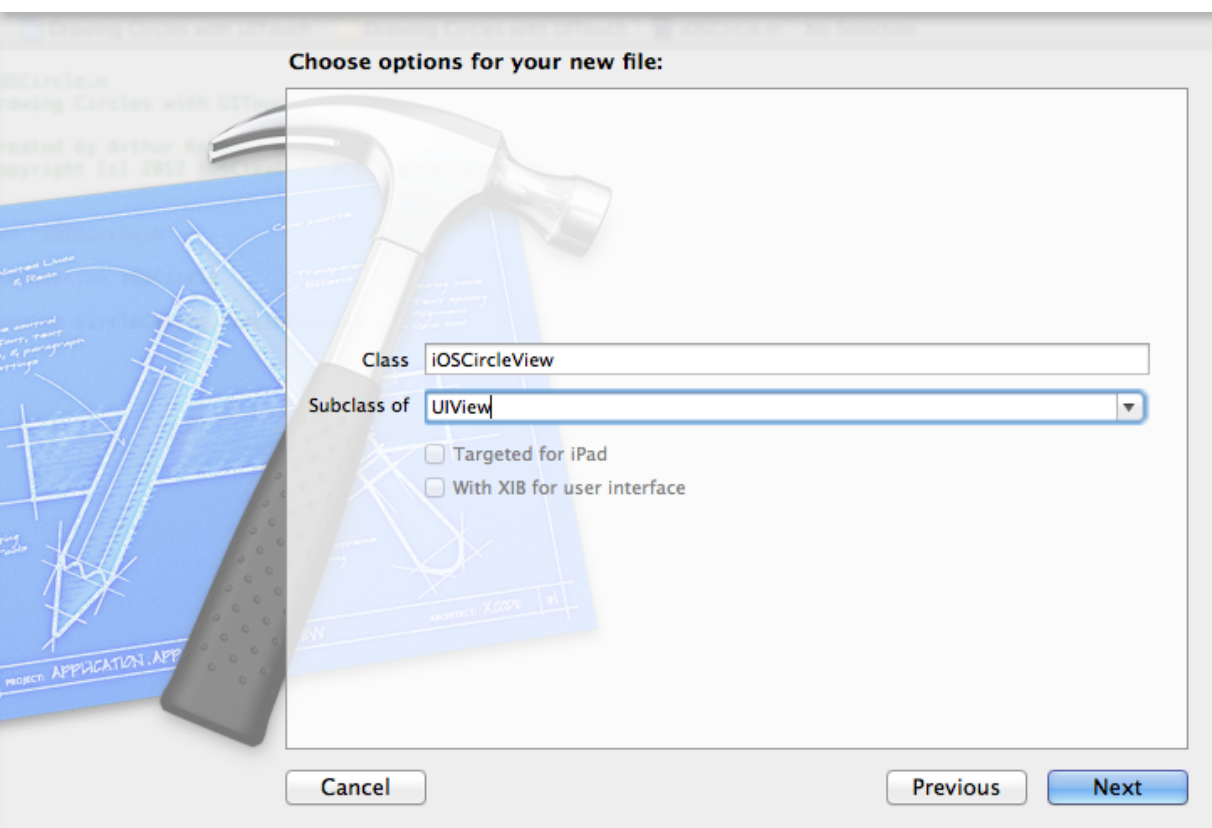

Synthesize these properties in iOSCircle.m

```
@implementation iOSCircle
```

```
@synthesize circleCenter,circleRadius;
```

```
@end
```

Create a New File. Select Objective-C Class. Call the class iOSCircleView with a subclass of UIView. This class will contain the View the circles will be drawn on.

Connect this view through the loadView method in iOSViewController.m

```
#import "iOSCircleView.h"
```

```
-(void)loadView
```

```
{
```

```
    // Create a view CGRect frame = [UIScreen mainScreen].bounds;
```

```
    iOSCircleView *v = [[iOSCircleView alloc] initWithFrame:frame];
```

```
    self.view = v;
```

Create an ivar and a method declaration in iOSCirclesView.h. The NSMutableArray will contain all iOSCircles objects which will be drawn and the drawCircle method will draw the circle using Core Graphics

```
@interface iOSCirclesView : UIView
{
    NSMutableArray *totalCircles;
}

- (void)drawCircle;

@end
```

initWithFrame is the designated initializer of a View so here we initialize the Array and we set the background color of the view.

```
- (id)initWithFrame:(CGRect)frame
{
    self = [super initWithFrame:frame];
    if (self)
    {
        // Initialization code
        totalCircles = [[NSMutableArray alloc] init];

        // Set background color
        self.backgroundColor = [UIColor whiteColor];
    }

    return self;
}
```

Override drawRect by calling the drawCircle method

```
- (void)drawRect:(CGRect)rect
{
    [self drawCircle];
}
```

Implement the drawCircle method

```
- (void)drawCircle
{
    // Get the Graphics Context
    CGContextRef context = UIGraphicsGetCurrentContext();

    // Set the circle outline-width
    CGContextSetLineWidth(context, 10.0);

    // Set the circle outline-colour
    [[UIColor redColor] set];

    // Loop through the circles and Draw these Circles to the view
    for (iOSCicle *circle in totalCircles)
    {
        // Create Circle
        CGContextAddArc(context, circle.circleCenter.x, circle.circleCenter.y, circle.circleRadius, 0.0, M_PI * 2.0, YES);

        // Draw
        CGContextStrokePath(context);
    }
}
```

We use two Constants to determine the minimum and maximum radius

of a circle at the top of iOSCirclesView.m

```
#define MINRADIUS 10
```

```
#define MAXRADIUS 30
```

To respond to a touch, you need to override the touchesBegan:withEvent method in iOSCirclesView.m.

```
- (void)touchesBegan:(NSSet *)touches withEvent:(UIEvent *)event
{
    // loop through the touches
    for (UITouch *touch in touches)
    { // Get location of Touch
        CGPoint location = [touch locationInView:self];

        // Create a new iOSCircles Object
        iOSCircles *newCircle = [[iOSCircles alloc] init];

        // Set the Center of the Circle
        newCircle.circleCenter = location;

        // Set a random Circle Radius
        newCircle.circleRadius = MINRADIUS + (arc4random()
        % MAXRADIUS);

        // Add the Circle Object to the Array
        [totalCircles addObject:newCircle];

        // update the view
        [self setNeedsDisplay];
    }
}
```

Build and Run the Application. Touch the screen to draw the circles.

You can download the source code of **DrawingCirclesWithUITouch** at the ioscreator repository on [github](#).

How can I adjust the code to add a UIView to the
iosViewController and have other controls in the view. Right now
if I add any control to the iosViewController it does not show up
when I run the app.
